

LAB#09

INTERPROCESS COMMUNICATION

Objective

To illustrate IPC through pipe and fork system calls

Exercise

1. What did you learn after running Program 1?

Running Program 1 illustrates inter-process communication (IPC) using pipes in Unix-like systems. The program creates a pipe and forks a child process. The parent process reads a limit for the Fibonacci series from the user, writes it to the pipe, and exits. The child process reads this limit from the pipe and computes the Fibonacci series, printing each number. This demonstrates creating and using pipes for IPC, the fork operation, and proper management of pipe endpoints to ensure data transfer. The program also highlights basic synchronization between processes, with the parent providing input and the child processing and outputting results.
